

Edeviser Architecture & Backend Connectivity

Generated: 8/1/2026 | Author: Edeviser AI Reviewer

1. Executive Architecture Summary

Edeviser is a Human-Centric Outcome-Based Education (OBE) and Gamification platform built for React 18, Vite 6, Tailwind CSS v4, and Supabase PostgreSQL with strict RLS policies.

- Baseline Institution: Noor International School (68 Profiles: 40 Students, 20 Parents, 4 Teachers, 3 Coordinators, 1 Admin).
- Database Security: Strict Security Definer & Invoker RPCs with explicit `auth.uid()` institution scoping.
- RPC Integrity: All 5 role dashboard RPCs (`get_admin_dashboard`, `get_admin_analytics`, `get_coordinator_dashboard`, `get_teacher_dashboard`, `get_student_dashboard`) execute on remote Supabase `cdlgtbvxlxjpcddjazzx` without hardcoded fallback constants.
- Pre-Commit Status: 100% GREEN (0 ESLint warnings, 0 TypeScript errors, 6,096 Vitest tests passing).

2. Role-by-Role Connectivity & Scoping

- Admin: Scoped via `auth.uid()` -> `profiles.institution_id`. Accesses `get_admin_dashboard()` and `get_admin_analytics(date, date)`.
- Coordinator: Scoped via `programs.coordinator_id = auth.uid()`. Accesses `get_coordinator_dashboard()`.
- Teacher: Scoped to assigned active courses & sections. Accesses `get_teacher_dashboard(uuid)`.
- Student: Scoped to enrolled `section_id`. Accesses `get_student_dashboard(uuid)`.
- Parent: Scoped via verified `parent_student_links`. Accesses `get_parent_dashboard()`.
