## FILE: AGENTS.md

TYPE: .md | LINES: 1-57 | SHA256: bbe9a5952da79c58dc9eb8661c1d8503064d9f6023c66c25f577c914c879f6da

```
1 | # Agent Instructions for Edeviser
2 |
3 | ## Project Overview
4 |
5 | Edeviser is a Human-Centric OBE (Outcome-Based Education) + Gamification platform for higher education. It tar
6 |
7 | ## Tech Stack
8 |
9 | - React 18 + TypeScript (strict mode), Vite 6
10 | - Tailwind CSS v4 + Shadcn/ui (New York style)
11 | - TanStack Query v5, TanStack Table, React Hook Form + Zod
12 | - Supabase (PostgreSQL + RLS, Edge Functions in Deno, Realtime, Storage)
13 | - i18next for i18n (Arabic/English), RTL layout support
14 | - Vitest for testing, fast-check for property-based tests
15 |
16 | ## Coding Rules
17 |
18 | - No `any` types - use `unknown` with type guards or proper interfaces
19 | - All database queries go through TanStack Query hooks in `src/hooks/`
20 | - Business logic lives in `src/lib/`, not in components or hooks
21 | - Use Shadcn/ui components - never raw HTML for interactive elements
22 | - Use logical CSS properties (`ms-*`, `me-*`, `ps-*`, `pe-*`) not physical (`ml-*`, `mr-*`)
23 | - Icon Containers: Icon wrappers/badges in section headers and card headers MUST use transparent (`bg-transparent`)
24 | - Use `@/` path alias for all imports
25 | - Use Sonner for toast notifications
26 | - Use Zod schemas for all form validation
27 |
28 | ## Pre-Commit Checks
```

```

29 |
30 | Run in order before any PR:
31 |
32 | 1. `npm run lint` - ESLint with zero warnings
33 | 2. `npx tsc --noEmit` - TypeScript type checking
34 | 3. `npm test` - Vitest test suite (runs `vitest --run`)
35 |
36 | ## Do Not Modify
37 |
38 | - `supabase/migrations/` - managed via Supabase MCP, not manually
39 | - `.kiro/` directory - Kiro IDE configuration
40 | - `src/types/database.ts` - auto-generated from Supabase schema
41 | - `.env.local` - contains secrets, gitignored
42 |
43 | ## Testing Conventions
44 |
45 | - Property-based tests: `src/__tests__/properties/*.property.test.ts` (fast-check, min 100 iterations)
46 | - Unit tests: `src/__tests__/unit/*.test.ts` or `*.test.tsx`
47 | - Use `@testing-library/react` for component tests
48 | - Reference design doc in property test comments: `// Feature: <name>, Property N: ...`
49 |
50 | ## File Structure
51 |
52 | - Components: `src/components/ui/` (Shadcn), `src/components/shared/` (custom)
53 | - Pages: `src/pages/{role}/` (admin, coordinator, teacher, student, parent)
54 | - Hooks: `src/hooks/` (TanStack Query hooks)
55 | - Lib: `src/lib/` (utilities, schemas, business logic)
56 | - Locales: `src/locales/{en,ar}/` (i18n JSON files)
57 |

```

// Playwright configuration for Edeviser.
// 
// Two test trees live side-by-side:
//   1. ./e2e/**/*.spec.ts - legacy smoke suite, kept runnable under the
//     `legacy-smoke` project (Chromium, Desktop Chrome,
//     no storageState, no audit fixtures).
//   2. ./tests/e2e/**/*.spec.ts - Pre-Deployment E2E Audit suite introduced by
//     .kiro/specs/pre-deployment-e2e-audit. Organised
//     into role sub-folders (admin/, coordinator/,
//     teacher/, student/, parent/, cross-role/, rtl/,
//     perf/) and exercised by the seven audit projects
//     below.
// 
// Per design.md $Browser and Viewport Matrix the audit projects cover:
//   - admin, coordinator, teacher, cross-role, rtl-ar !' Desktop Chrome @ 1440x900
//   - student !' iPhone 13 (Chromium) @ 390x844
//   - parent !' iPhone 13 (WebKit) @ 390x844
// 
// Reduced motion is enabled on every audit project so that custom animations
// (shimmer, xp-pulse, badge-pop, float, streak-flame, fade-in-up) are disabled
// during assertions – see requirements.md §9.5.

```

1 | > Why do I have a folder named ".vercel" in my project?
2 | The ".vercel" folder is created when you link a directory to a Vercel project.
3 |
4 | > What does the "project.json" file contain?
5 | The "project.json" file contains:
6 | - The ID of the Vercel project that you linked ("projectId")
7 | - The ID of the user or team your Vercel project is owned by ("orgId")
8 |
9 | > Should I commit the ".vercel" folder?
10 | No, you should not share the ".vercel" folder with anyone.
11 | Upon creation, it will be automatically added to your ".gitignore" file.
12 |

1 | # Edeviser – Clickable Prototype (Variation A)
2 |
3 | A **frontend-only** clickable prototype of the AI-first learning ecosystem across five roles
4 | (Student, Teacher, Parent, Coordinator, Admin).
5 |
6 | > & p This is a mockup. It is **not** connected to any backend** – all data is fake/hardcoded,
7 | > the "AI" replies are scripted, and nothing here talks to the real database or the real app.
8 | > It exists only for design review and is safe to delete at any time.
9 |
10 | ## How to view it
11 |
12 | **Start page:** open `roles.html` (the role chooser). Or `start.html`.
13 |
14 | - Use the floating dock (bottom-center on desktop, top-right on mobile) to:
15 |   - toggle **0=0 Mobile / 0=0 Laptop** view,
16 |   - **switch role**,
17 |   - jump between screens.
18 | - Role dashboards look best in **0=0 Laptop** mode.
19 |
20 | ### Option 1 – just open the files
21 | Open `roles.html` in any browser. (Needs internet: it loads Tailwind + fonts from a CDN.)
22 |
23 | ### Option 2 – run a tiny local server
24 | ```bash
25 | npx serve .
26 | # then open the printed http://localhost:3000/roles.html
27 | ```
28 |
29 | ## How to share with a reviewer (live link)
30 |
31 | From **inside this `prototype/` folder** (so only the prototype is deployed, never the real app):
32 | ```bash
33 | npx vercel deploy --prod
34 | ```
35 | Vercel will ask for a project name (e.g. `edeviser-prototype`) and give you a shareable URL.
36 | `vercel.json` redirects the root URL to the role chooser.
37 |
38 | ### How to remove it later
39 | ```bash
40 | npx vercel remove edeviser-prototype # or delete the project in the Vercel dashboard
41 | ```
42 | Removing the deployment (or deleting the git branch it lives on) has **zero impact** on the real app.
43 |
44 | ## Structure
45 | - `roles.html` / `start.html` – entry / role chooser
46 | - `dashboard.html`, `lesson.html`, `review.html`, `tutor.html`, `path.html`, ... – student experience
47 | - `teacher-*.html`, `parent-*.html`, `coordinator-*.html`, `admin-*.html` – other roles
48 | - `shared.css` / `shared.js` – the role-aware shell (nav, rail, search, notifications)
49 |

```

1 | # Edeviser Platform
2 |
3 | Outcome-Based Education + Gamification platform for higher education institutions.
4 |
5 | ## Tech Stack
6 |
7 | - React 18 + TypeScript, Vite 6, Tailwind CSS v4, Shadcn/ui
8 | - Supabase (PostgreSQL + RLS, Auth, Realtime, Storage, Edge Functions)
9 | - Deployed on Vercel
10 |
11 | ## Getting Started
12 |
13 | ```bash
14 | npm install
15 | cp .env.example .env.local # fill in your Supabase credentials
16 | npm run dev
17 | ```
18 |
19 | ## Scheduled Jobs (Cron)
20 |
21 | The platform uses scheduled jobs for streak risk emails, weekly summaries, at-risk signal computation, perfect
22 | Two approaches are supported depending on your Supabase plan:
23 |
24 | ### Option A: pg_cron (Supabase Pro / Self-Hosted)
25 |
26 | pg_cron runs scheduled jobs directly inside PostgreSQL. This is the primary approach and requires the Supabase
27 | The migration `20260615000001_conditional_pgcron_guard.sql` automatically detects whether pg_cron is available
28 |
29 | | Job | Schedule | Action |
30 | |-----|-----|-----|
31 | | leaderboard-refresh | Every 5 min | `REFRESH MATERIALIZED VIEW CONCURRENTLY leaderboard_weekly` |
32 | | streak-risk-email | Daily 8 PM UTC | Calls `streak-risk-cron` Edge Function |
33 | | weekly-summary-email | Monday 8 AM UTC | Calls `weekly-summary-cron` Edge Function |
34 | | compute-at-risk-signals | Daily 2 AM UTC | Calls `compute-at-risk-signals` Edge Function |
35 | | perfect-day-prompt | Daily 6 PM UTC | Calls `perfect-day-prompt` Edge Function |
36 | | streak-midnight-reset | Daily midnight UTC | Calls `process-streak` Edge Function |
37 | | ai-at-risk-prediction | Daily 3 AM UTC | Calls `ai-at-risk-prediction` Edge Function |
38 | | notification-digest | Daily 8 PM UTC | Calls `notification-digest` Edge Function |
39 | | fee-overdue-check | Daily 6 AM UTC | Updates overdue fee payments |
40 |
41 |
42 | ### Option B: Vercel Cron Jobs (Free Tier Fallback)
43 |
44 | If pg_cron is not available (Supabase free tier), Vercel Cron Jobs serve as the fallback. Cron schedules are d
45 | Required environment variables (set in Vercel dashboard):
46 |
47 | | Variable | Description |
48 | |-----|-----|
49 | | `CRON_SECRET` | Shared secret for authenticating cron requests |
50 | | `SUPABASE_URL` | Your Supabase project URL |
51 | | `SUPABASE_SERVICE_ROLE_KEY` | Service role key (server-side only, never exposed to client) |
52 |
53 | The migration guard function `is_pgcron_available()` ensures cron job SQL is skipped on free tier, so migratio
54 |
55 | ### How It Works
56 |
57 | 1. Migrations run `CREATE EXTENSION IF NOT EXISTS pg_cron` – this succeeds on Pro, silently fails on free tier
58 | 2. The guard migration checks `is_pgcron_available()` before calling `cron.schedule()`.
59 | 3. On free tier, Vercel Cron Jobs (configured in `vercel.json`) hit `/api/cron/*` routes which forward to Edge
60 | 4. Both approaches call the same Edge Functions, so behavior is identical.
61 |
62 | ## Deployment
63 |
64 | The project is deployed on [Vercel](https://vercel.com) with GitHub integration:
65 |
66 | - **Production**: auto-deploys on merge to `main`
67 | - **Preview**: auto-deploys on every pull request (unique URL per PR)
68 |
69 | Branch deployment is configured in `vercel.json` via the `git.deploymentEnabled` setting. Connect the GitHub r
70 | Required Vercel environment variables are listed in the Environment Variables section below.
71 |
72 | ## Environment Variables
73 |
74 | | Variable | Where | Description |
75 | |-----|-----|-----|
76 | | `VITE_SUPABASE_URL` | `.env.local` | Supabase project URL (client-side) |
77 | | `VITE_SUPABASE_ANON_KEY` | `.env.local` | Supabase anon key (client-side) |
78 | | `SUPABASE_URL` | Vercel env | Supabase project URL (server-side) |
79 | | `SUPABASE_SERVICE_ROLE_KEY` | Vercel env | Service role key (server-side only) |
80 | | `CRON_SECRET` | Vercel env | Secret for Vercel Cron authentication |
81 |
82 | ## Health Check & Uptime Monitoring
83 |
84 | The platform exposes a health check Edge Function at `/functions/v1/health` that returns:
85 |
86 | ```json
87 |
88 |
89 |

```

```

90 | { "status": "ok", "database": "connected", "timestamp": "2024-01-15T10:30:00Z" }
91 |
92 |
93 | It verifies database connectivity with a lightweight query and returns HTTP 503 if the database is unreachable
94 |
95 | ### Uptime Monitoring Setup (BetterUptime / Checkly)
96 |
97 | Configure your monitoring service to poll the health endpoint:
98 |
99 | | Setting | Value |
100 | |-----|-----|
101 | | URL | `https://<project-ref>.supabase.co/functions/v1/health` |
102 | | Method | `GET` |
103 | | Check interval | 60 seconds |
104 | | Confirmation period | 2 consecutive failures before alerting |
105 | | Expected status | 200 |
106 | | Expected body contains | `{"status":"ok"}` |
107 |
108 | Alert channels (Slack, email, PagerDuty) are configured in the monitoring service dashboard. Target uptime SLA
109 |
110 | ## Scripts
111 |
112 | ```bash
113 | npm run dev          # Start dev server
114 | npm run build        # Type-check + build
115 | npm run lint         # ESLint (zero warnings)
116 | npm test             # Vitest (single run)
117 | ```
118 |

```

```
1 // Pre-deployment audit – admin mutation audit-log coverage scanner.
2 //
3 // Implements Task 13.5 / Req 13.5: every admin mutation hook MUST write a row
4 // to audit logs. This is a Blocker-class invariant per
5 // .kiro/steering/domain-knowledge.md: "Audit logs are append-only" and
6 // "All admin mutations must log to audit_logs".
7 //
8 // Heuristic (intentionally conservative to avoid false positives):
9 //   A file is in-scope when it imports `logAuditEvent` from '@lib/auditLogger'.
10 //   That import signals the developer's intent: "this hook file records
11 //   audit events." If ANY useMutation in that file does NOT call
12 //   logAuditEvent inside its mutationFn body, that is a Blocker.
13 //
14 // False-positive control:
15 //   - Files that don't import logAuditEvent are out of scope. Non-admin
16 //     hook files (e.g., student self-service mutations) legitimately don't
17 //     need audit logs, so we don't scan them.
18 //   - Mutations that only call Edge Functions via .invoke() are trusted –
19 //     the Edge Function is responsible for its own audit logging.
20 //   - Files listed in audit/baselines/audit-log-coverage-exceptions.json
21 //     are suppressed with a documented rationale. Exceptions with an
22 //     'expiresAt' timestamp become active findings once the date passes –
23 //     this keeps the backlog honest and prevents exceptions from becoming
24 //     permanent skeletons in the closet.
25 //
26 // Precision vs recall tradeoff: we prefer recall (catching real regressions)
27 // over false positives. The scoping-by-import rule means we miss the
28 // "someone added an admin hook file and forgot to import logAuditEvent at
29 // all" case – but that's a rarer and more obvious regression that a code
30 // review or the zodResolver scan (§13.3) will also catch.

2 //
3 // Implements Task 14.4 / Req 12.4: every realtime subscription MUST pass a
4 // filter. Unfiltered subscriptions are both a performance risk (every row
5 // change floods every subscriber) and a privacy risk (the client receives
6 // rows it shouldn't see). Per .kiro/steering/supabase-patterns.md:
7 // "Always scope realtime subscriptions with filters (don't subscribe to
8 // entire tables)".
9 //
10 // Two subscription shapes to detect:
11 //
12 // 1. Centralized: `useRealtime({ table, event, filter?, onPayload })` call
13 // sites. The Edeviser codebase routes most realtime work through this
14 // hook – when `filter` is missing or resolves to `undefined`, the
15 // subscription covers the entire table.
16 //
17 // 2. Direct: `supabase.channel(name).on('postgres_changes', config, cb)`
18 // call sites where the config object must carry a `filter:` key.
19 //
20 // Severity: Major per requirements.md §12.6. Escalates to Critical if we
21 // detect this on tables listed in TENANT_SCOPED_TABLES because those are
22 // known to leak cross-tenant data without a filter.

```
1 | /**
2 |  * Feature: dashboard-and-ux-performance – Req 2 (per-role dashboard aggregate
3 |  * RPC), task 2.7 – RLS data-leakage assertion for `get_student_dashboard`.
4 |  *
5 |  * `get_student_dashboard(p_student_id uuid)` is `SECURITY INVOKER`, so every
6 |  * underlying read is RLS-checked as the CALLER. The guarantee we must prove is
7 |  * therefore a DATA guarantee, not an error guarantee: a student calling the RPC
8 |  * with ANOTHER student's id does NOT raise – it simply returns the rows their
9 |  * own RLS permits, which for another student's scoped tables is none. So the
10 |  * success/rejected `runRlsCases` runner (which only inspects `{ error }`) cannot
11 |  * express this; this file calls the RPC directly and asserts on the returned
12 |  * payload instead.
13 |  *
14 |  * Matrix (uses only the seed graph: the primary student is enrolled in exactly
15 |  * one seeded course; `otherStudentId` is enrolled in none):
16 |  * 1. student A `!` `get_student_dashboard(A)` `!` own data flows through
17 |  *   (`kpis.enrolledCourses === 1`).
18 |  * 2. student A `!` `get_student_dashboard(B)` `!` NO leakage of B's data
19 |  *   (`enrolledCourses === 0`, and `deadlines`/`announcements`/`attendance`
20 |  *   all empty) – the core anti-leakage assertion.
21 |  * 3. student B `!` `get_student_dashboard(A)` `!` symmetric: A's data is
22 |  *   invisible to B (`enrolledCourses === 0`).
23 |  *
24 |  * Skip-safety (Req 19.7): wrapped in `describe.skipIf(!shouldRunRls())`, so with
25 |  * no preview secrets the whole block – including seed/teardown – is skipped and
26 |  * `npm run test:rls` exits 0. The RPC already exists (migration
27 |  * `20260821000006_create_get_student_dashboard_rpc.sql`), so unlike the
28 |  * red-first nudge smoke test this suite is GREEN on the `rls-smoke` preview job.
29 |  *
30 |  * The `get_student_dashboard` RPC is in the generated `Database` types (added
31 |  * by the post-merge type regen for task 2.2), so the `client.rpc(...)` call is
32 |  * fully typed; the `Json` return is cast to the small shape this test asserts on.

1 | /**
2 |  * Feature: dashboard-and-ux-performance - Phase 8 Task 33 - deny-side RLS
3 |  * assertion for `get_teacher_dashboard`.
4 |  *
5 |  * `get_teacher_dashboard(p_teacher_id uuid)` is `SECURITY DEFINER` with a
6 |  * fail-closed guard: if `p_teacher_id <> auth.uid()` the id is neutralized to
7 |  * null so every read returns empty/zero. Combined with the function only ever
8 |  * reading data scoped to `courses.teacher_id = <caller>`, this proves a caller
9 |  * can never obtain another user's teaching data, and a non-teacher obtains
10 |  * nothing.
11 |  *
12 |  * Harness note: the RLS seed fixtures expose STUDENTS (not a second teacher), so
13 |  * this suite proves the two deny-side guarantees expressible with that graph:
14 |  * 1. student A != get_teacher_dashboard(A) != guard passes (id == caller) but A
15 |  *    owns no courses as a teacher, so the payload is empty (a non-teacher sees
16 |  *    nothing).
17 |  * 2. student A != get_teacher_dashboard(B) != guard NEUTRALIZES (id != caller)
18 |  *    != empty payload (no cross-user leakage).
19 |  * A full teacher-A-cannot-see-teacher-B assertion needs a second seeded teacher;
20 |  * tracked as a seed-harness follow-up. The SECURITY DEFINER guard pattern is
21 |  * identical to the already-green `get_student_dashboard` deny-side suite.
22 |  *
23 |  * Skip-safe (Req 19.7): wrapped in `describe.skipIf(!shouldRunRls())`, so without
24 |  * preview secrets the whole block is skipped and `npm run test:rls` exits 0.
25 |  *
26 |  * `get_teacher_dashboard` is not yet in the generated `Database` types (added by
27 |  * migration 20260821000011; types regenerate post-merge), so the rpc call is made
28 |  * through a narrow typed cast rather than `any`.

1 | /**
2 |  * Feature: qa-partner-review-remediation - Req 19 (RLS_Smoke_Test)
3 |  *
4 |  * Production guard + run-gating for the isolated RLS integration smoke suite.
5 |  *
6 |  * The RLS smoke tests perform REAL inserts/updates against a live Supabase
7 |  * database using a service-role key. They must therefore NEVER run against the
8 |  * production project. This module centralises the two safety decisions used by
9 |  * `vitest.integration.config.ts` and by every test file in this folder:
10 |  *
11 |  * 1. `assertNotProduction()` - a HARD guard that throws before any test or

```

```

1  seed runs when the suite is asked to run (`SUPABASE_DB_ENV` === "preview")
2  but the configured Supabase URL points at the production project ref.
3  It is invoked at config load time so the run aborts immediately.
4
5  2. `rlsSkipReason()` / `shouldRunRls()` – a SOFT gate used by the test
6  files. When the required preview secrets are absent (the normal case on
7  a developer machine or the unit-CI job), the suite marks itself
8  `describe.skip` instead of failing, so local/unit CI stays green. The
9  dedicated `rls-smoke` CI job (which sets the secrets) is the only place
10 the cases actually execute.
11
12 * Required environment variables (set only in the dedicated `rls-smoke` CI job
13 against a Supabase PREVIEW branch – never in production):
14
15 * - SUPABASE_URL Preview branch REST URL (https://<ref>.supabase.co)
16 * - SUPABASE_ANON_KEY Anon/publishable key, used for per-role sign-in
17 * - SUPABASE_SERVICE_ROLE_KEY Service-role key, used for Admin-API seeding
18 * - SUPABASE_DB_ENV Must equal "preview" for the suite to run
19
20 * Note: these are intentionally the un-prefixed names (not the `VITE_*` app
21 variables) because this suite runs under Node, outside the Vite app bundle.
22 */
23

1 | /**
2 |  * Deny-side parity for the habit_logs RLS optimizations.
3 |  *
4 |  * Migration 20260821000030 wrapped the bare `auth_user_role()` /
5 |  * `auth_institution_id()` calls in `(select ...)` (InitPlan caching) and dropped
6 |  * a redundant student-own SELECT policy.
7 |  *
8 |  * Migration 20260822000003 then CONSOLIDATED the remaining policies to exactly
9 |  * one permissive policy per command (SELECT/INSERT/UPDATE/DELETE) and replaced
10 |  * the inline `student_id IN (SELECT ... FROM profiles ...)` institution filter
11 |  * with the SECURITY DEFINER helper `is_student_in_my_institution()` (planner-cost
12 |  * flattening). Both migrations are behavior-preserving by construction, but a
13 |  * consolidation could regress into a cross-student or cross-institution leak –
14 |  * this suite proves it does not, asserting the ALLOWED and DENIED rows for the
15 |  * student (own), parent (verified link), and staff/admin (institution) branches.
16 |  *
17 |  * A SELECT RLS policy does not raise on denial; it silently filters rows. So,
18 |  * like rlsConsolidation.rls.test.ts, this asserts on the ROWS each signed-in
19 |  * role can read: BOTH the allowed case (owner / verified parent sees the row)
20 |  * AND the denied case (a different student, or the parent of a different child,
21 |  * sees NONE of them).
22 |  *
23 |  * Skip-safety (Req 19.7): the block is `describe.skipIf(!shouldRunRls())`, so
24 |  * with no preview secrets nothing connects and `npm run test:rls` exits 0. It
25 |  * runs for real only on the dedicated `rls-smoke` preview CI job (which has the
26 |  * migration applied on the Supabase preview branch).

```

1  /**
2  * Feature: qa-partner-review-remediation – Req 19 (RLS_Smoke_Test), task 5.3
3  *
4  * Baseline RLS insert smoke cases for `teams` and `social_challenges`
5  * (realizes part of Property 8 – RLS conformance across mutation paths/roles).
6  *
7  * This file ONLY declares cases and hands them to {@link runRlsCases} (built in
8  * task 5.2). It reuses the existing harness verbatim – the runner, the seeded
9  * context, and the per-role sign-in helper – and adds no new infrastructure.
10 *
11 * Cases (Req 19.3, 19.4, 19.5):
12 *   1. teams – teacher creates a team populating every NOT NULL
13 *      column (name, course_id, institution_id,
14 *      captain_id, created_by) for their own course
15 *      !' success.
16 *   2. social_challenges – teacher creates a challenge with a fully
17 *      whitelisted, constraint-satisfying payload
18 *      (real columns only) !' success.
19 *   3. social_challenges – STUDENT attempts to create a challenge !' rejected
20 *      (the `social_challenges_insert` WITH CHECK requires
21 *      role admin/teacher).
22 *
23 * Skip-safety (Req 19.7): `runRlsCases` wraps the whole suite in
24 * `describe.skipIf(!shouldRunRls())`, so with no preview secrets nothing
25 * connects and `npm run test:rls` exits 0. The custom teardown below is only
26 * ever invoked from `afterAll` inside that guarded block, so `createAdminClient`
27 * is never called when the suite is skipped.
28 *
29 * Teardown note (FK / cleanup): `teams.course_id` and `social_challenges.course_id`
30 * reference `courses(id)` WITHOUT `ON DELETE CASCADE` (verified in
31 * `supabase/migrations/20260411221627_create_teams_and_social_challenges.sql`).
32 * The default `teardownRlsFixtures` deletes the seeded course, which would be
33 * blocked by the rows these cases insert. So the suite's teardown is wrapped to
34 * delete the inserted `social_challenges`/`teams` rows (scoped to the seeded
35 * course) BEFORE delegating to the default teardown. Fixtures are namespaced
36 * per `runId`, so this stays best-effort and collision-free.

```

1 | /**
2 |  * Feature: qa-partner-review-remediation – Req 1 (Nudge_Service) + Req 19
3 |  * (RLS_Smoke_Test), task 9.1 – RED FIRST.
4 |
5 |  * RLS insert smoke cases for the teacher! student Nudge, exercised through the
6 |  * authorized `send_teacher_nudge(p_student_id uuid, p_message text)` RPC.
7 |
8 |  * & p RED-FIRST: this file is written BEFORE the RPC exists. The RPC is created
9 |  * in task 9.2, its types regenerated in 9.3, and `useSendNudge` is routed
10 |  * through it in 9.4. Until 9.2 lands, `rpc("send_teacher_nudge", ...)` resolves
11 |  * with a "function does not exist" error, so:
12 |  * - the "own student !" success" case FAILS (an error is present where none is
13 |  *   expected) – this failure is the proof the smoke test detects the bug;
14 |  * - the "non-taught student !" rejected" case happens to be satisfied for the
15 |  *   wrong reason (any error counts as rejected), and flips to a genuine
16 |  *   authorization rejection (`42501`) once the RPC ships.
17 |  * This red signal only manifests in the dedicated `rls-smoke` CI job against a
18 |  * Supabase preview branch (secrets present). With no secrets – the normal local
19 |  * / unit-CI case – `runRlsCases` skips the whole suite, so `npm run test:rls`
20 |  * still exits 0 (Req 19.7 / skip-safety).
21 |
22 |  * Cases (Req 1.8, 19.3, 19.4, 19.5):
23 |  * 1. notifications (via nudge RPC) – teacher nudges their OWN enrolled student
24 |  *    !' success (the RPC confirms the `courses "E student.courses` teaching
25 |  *    relationship for `auth.uid()` and inserts the notification).
26 |  * 2. notifications (via nudge RPC) – teacher nudges a NON-taught student
27 |  *    (`ctx.otherStudentId`, deliberately un-enrolled by the seed) !' rejected
28 |  *    (the RPC must raise an authorization error and insert nothing – Req 1.8).
29 |
30 |  * This file ONLY declares cases + hands them to {@link runRlsCases} (task 5.2),
31 |  * reusing the existing harness, seeded context, and per-role sign-in verbatim.
32 |
33 |  * Typing note (red-first): `send_teacher_nudge` is not in the generated
34 |  * `Database` types until task 9.3, so a direct `client.rpc("send_teacher_nudge",
35 |  * ...)` would not type-check yet. We therefore route the call through a tiny
36 |  * helper that casts ONLY the `rpc` method to a loose signature. This does NOT
37 |  * use `.from/.insert/.update/.upsert(... as never)` – the patterns the

```

```

38 | * Static_Cast_Guard (Req 17) forbids – so the guard stays green. Once 9.3
39 | * regenerates the types, this helper can be deleted and the call made directly.
40 |
41 | * Teardown note (FK / cleanup): `notifications.user_id` references
42 | * `profiles(id)` WITHOUT `ON DELETE CASCADE` (see
43 | * `supabase/migrations/20260222073828_create_system_tables.sql`). Once 9.2 lands
44 | * and the success case actually inserts a notification row, the default
45 | * `teardownRlsFixtures` (which deletes the seeded student's auth user/profile)
46 | * would be blocked by that row. So the suite's teardown is wrapped to delete the
47 | * inserted `notifications` rows (scoped to the seeded students) BEFORE delegating
48 | * to the default teardown. Fixtures are namespaced per `runId`, so this stays
49 | * best-effort and collision-free, and it is a no-op on the current red-first run
50 | * (no row is inserted while the RPC is absent).

```
1  /**
2  * Feature: profile-picture-upload + profiles RLS recursion fix.
3  *
4  * Deny-side RLS cases for UPDATE on public.profiles, guarding the fix in
5  * migration 20260821000019_fix_profiles_update_own_recursion.sql.
6  *
7  * Background: the previous `profiles_update_own` WITH CHECK enforced
8  * immutability of role / institution_id / status via an inline SELECT on
9  * `profiles`, which made every UPDATE abort with SQLSTATE 42P17 ("infinite
10 * recursion detected in policy for relation profiles"). That broke the language
11 * switcher, theme / notification preferences, AND the avatar upload's
12 * profiles.avatar_url write (all surfaced as HTTP 500). The fix re-sources the
13 * current values from the SECURITY DEFINER helpers (auth_user_role /
14 * auth_institution_id / auth_user_status), which bypass RLS, so the guard is
15 * preserved without recursion.
16 *
17 * Cases (allowed AND denied for the self-update path – Req: deny-side per
18 * role × table):
19 *   1. profiles – student updates a benign own column (preferred_language)
20 *       !' success (the exact path that used to 500 with 42P17).
21 *   2. profiles – parent updates a benign own column (preferred_language)
22 *       !' success.
23 *   3. profiles – student attempts to escalate their own role to 'admin'
24 *       !' rejected (WITH CHECK pins role to the stored value).
25 *   4. profiles – student attempts to change their own status to 'active'...
26 *       actually to a different value !' rejected (status is pinned).
27 *
28 * Skip-safety: runRlsCases wraps everything in describe.skipIf(!shouldRunRls()),
29 * so with no preview secrets nothing connects and `npm run test:rls` exits 0.
30 * Default teardown deletes the seeded users (cascading their profiles), so the
31 * benign preferred_language writes need no special cleanup and the rejected
32 * cases make no changes at all.

```
1  /**
2  * Feature: dashboard-and-ux-performance – Req 13 (H1 RLS permissive-policy
3  * consolidation) – deny-side parity for the merged SELECT policies.
4  *
5  * H1 merges the multiple permissive SELECT policies on six hot tables into ONE
6  * policy each. This is behavior-identical BY CONSTRUCTION: Postgres OR-combines
7  * permissive policies for the same (role, cmd), so a single policy whose USING
8  * clause is `pred_A OR pred_B OR ...` (built from the exact same per-role
9  * predicates) grants precisely the same rows as the separate policies it
10 * replaces. The migrations that record each merge:
11 *
12 * xp_transactions      20260821000023  -> xp_transactions_read
13 * student_gamification 20260821000024  -> gamification_read
14 * outcome_attainment   20260821000025  -> attainment_read
15 * grades                20260821000026  -> grades_read
16 * submissions           20260821000027  -> submissions_read
17 * profiles              20260821000028  -> profiles_read
18 * reflection_digests    20260822000002  -> reflection_digests_read
19 *
20 * A SELECT RLS policy does not raise on denial – it silently filters rows – so
21 * this suite asserts on the ROWS a signed-in role can read (like
22 * getStudentDashboard.rls.test.ts), not on `{ error }`. For each table it proves
23 * BOTH the allowed case (the permitted role sees the seeded row) AND the denied
24 * case (a non-permitted authenticated user – another student, or the parent of a
25 * different child, or a teacher of a course the student is not in – sees NONE of
26 * them). That is the guarantee a consolidation could regress: a leak across the
27 * OR-merge.
28 *
29 * Coverage of predicate SHAPES (every branch that appears in the six merges):
30 * - self (student_id / id = auth.uid())           !' gamification, profiles, submissions
31 * - verified parent (parent_student_links)         !' gamification, attainment, submissions, grades, pr
32 * - teacher scope (course / assignment / enrollment) !' submissions, grades, profiles
33 * - admin / coord (institution scope)              !' profiles (admin + coordinator branches)
34 * - submission join (grades via submissions)        !' grades
35 *
36 * xp_transactions is intentionally NOT seeded here: it is append-only (a
37 * BEFORE DELETE/UPDATE trigger `prevent_xp_transactions_mutation` raises) and
38 * its FK to profiles is ON DELETE NO ACTION, so a seeded row cannot be cleaned
39 * up and would wedge fixture teardown. Its merged predicate
40 * ( `student_id = auth.uid() OR (admin AND student_id IN <institution>)` ) is the
41 * simplest of the six and is the same self/admin shape exercised live on
42 * student_gamification and profiles below, plus it is validated end-to-end by
43 * the Supabase Preview replay of migration 20260821000023.
44 *
45 * Skip-safety (Req 19.7): the whole block is `describe.skipIf(!shouldRunRls())`,
46 * so with no preview secrets nothing connects and `npm run test:rls` exits 0.
47 * It executes for real only on the dedicated `rls-smoke` preview CI job.

1 | /**
2 |  * Feature: qa-partner-review-remediation – Req 19 (RLS_Smoke_Test), task 5.2
3 |  *
4 |  * Table-driven runner for the RLS / insert integration smoke suite.
5 |  *
6 |  * The whole suite is RLS-conformance-by-example: each {@link RLSCase} declares a
7 |  * table, the role to act as, a real mutation/RPC, and whether the table's RLS
8 |  * policy should let it through. {@link runRlsCases} wires those declarations
9 |  * into a Vitest suite that:
10 |  *
11 |  * 1. Is wrapped in `describe.skipIf(!shouldRunRls())` so that, with no preview
12 |  *    secrets, the entire block (including the seed/teardown hooks) is skipped
13 |  *    and `npm run test:rls` exits green (Req 19.7 / skip-safety). No secrets !0
14 |  *    no client is ever constructed.
15 |  * 2. Seeds the real fixture graph ONCE in `beforeAll` (Req 19.1) and tears it
16 |  *    down in `afterAll` (idempotent/best-effort).
17 |  * 3. For each case: signs in a FRESH anon client as the case's role (Req 19.2),
18 |  *    awaits the real action, and asserts `success` (no error) or `rejected`
19 |  *    (error present – and, when identifiable, an RLS/permission error)
20 |  *    (Req 19.3 / 19.4).
21 |  *
22 |  * Extensibility (Req 19.6): adding coverage is a single {@link RLSCase} array
23 |  * entry – see task 5.3 ( `inserts.rls.test.ts` ). This module intentionally ships
24 |  * NO real cases; it only exports the runner + types.

1 | /**
2 |  * Feature: qa-partner-review-remediation – Req 19 (RLS_Smoke_Test), tasks 5.2
3 |  *
4 |  * Seeding + teardown for the RLS / insert integration smoke suite.
5 |  *
6 |  * This module uses the Supabase **Admin API** (service-role key) to create the
7 |  * minimal real fixtures the RLS cases need, on a Supabase **PREVIEW branch
8 |  * only**. It is *never* imported into the app bundle and is only ever invoked
9 |  * from the integration suite, which itself is gated behind `shouldRunRls()`
10 |  * (see `runner.ts`) so that a developer machine / unit-CI without secrets skips
11 |  * cleanly instead of attempting any live work.
12 |  *
13 |  * Skip-safety contract:
14 |  * - Importing this module MUST NOT throw and MUST NOT create any client.
15 |  * - `createClient` and every network call live inside the exported functions,
16 |  *   which are only called when `shouldRunRls()` is true.
17 |  *
18 |  * What gets seeded (Req 19.1):
19 |  * - One shared institution (`join_mode = 'open'` so the `handle_new_user`
20 |  *   trigger never raises on a non-student role) + a program + a semester.
21 |  * - One auth user per role (admin, coordinator, teacher, student, parent),
22 |  *   each with a matching `profiles` row whose `role` is upserted to the
23 |  *   correct value (the trigger would otherwise force `student`).
24 |  * - A SECOND student (`otherStudentId`) that is intentionally NOT enrolled in
25 |  *   the teacher's course – the target for negative nudge / RLS cases.
26 |  * - A course taught by the seeded teacher, a `course_section`, a
27 |  *   `student_courses` enrollment for the seeded student, and a verified
28 |  *   `parent_student_links` row linking parent !' student.
29 |  *
30 |  * Everything is namespaced by a per-run UUID so concurrent runs never collide,
31 |  * and `teardownRlsFixtures` deletes the created auth users (cascading their
32 |  * profiles) plus every fixture row best-effort/idempotently in dependency order.

2 |  * Feature: qa-partner-review-remediation – Req 19 (RLS_Smoke_Test), task 5.2
3 |  *
4 |  * Per-role sign-in helper (Req 19.2).
5 |  *
6 |  * Each call creates a FRESH **anon** client (`createClient(url, anonKey)`) and
7 |  * signs in with the seeded credentials for the requested role. A fresh client
8 |  * per call is deliberate: RLS is evaluated against the signed-in `auth.uid()`,
9 |  * so reusing one client across roles would leak sessions and produce false
10 |  * results. The returned client is authenticated as exactly that role and is
11 |  * what the RLS cases use to perform their real insert/update/RPC.
12 |  *
13 |  * Skip-safety contract: importing this module MUST NOT throw and MUST NOT
14 |  * create any client. `createClient` + `signInWithPassword` only run inside
15 |  * `signInAs`, which is only ever called on the live path guarded by
16 |  * `shouldRunRls()`.
17 |  */

1  /**
2   * Deny-side parity for the team_members RLS consolidation (migration
3   * 20260822000004).
4   *
5   * That migration merges 7 permissive policies into one per command
6   * (SELECT/INSERT/UPDATE/DELETE) and replaces every inline
7   * `team_id IN (SELECT ... FROM teams ...)` subquery with SECURITY DEFINER
8   * helpers (planner-cost flattening). It is behavior-preserving by construction,
9   * but a consolidation could regress into a leak or a broken write path – this
10  * suite proves it does not, asserting the ALLOWED and DENIED cases for each
11  * branch:
12  *   SELECT – student(enrolled) / teacher(course) / admin(institution) /
13  *           parent(verified link); coordinator + non-enrolled student denied.
14  *   INSERT – student self-add allowed; a non-captain/non-teacher inserting
15  *           someone else denied.
16  *   UPDATE – captain of a STUDENT_FORMED team allowed; the SAME captain on a
17  *           TEACHER_ASSIGNED team denied (the student_formed gate); teacher of
18  *           the course allowed.
19  *
20  * A SELECT/UPDATE RLS policy does not raise on denial – it filters rows – so
21  * those cases assert on the row count returned (0 = filtered). INSERT denial
22  * raises (WITH CHECK !' 42501), so those assert on a truthy error.
23  *
24  * Skip-safety (Req 19.7): `describe.skipIf(!shouldRunRls())`, so with no preview
25  * secrets nothing connects and `npm run test:rls` exits 0. It runs for real only
26  * on the dedicated `rls-smoke` preview CI job (migration applied on the branch).

1 | /**
2 |  * Feature: coordinator timetable management – RLS write policy.
3 |  *
4 |  * Deny-side RLS cases for INSERT on public.timetable_slots, guarding migration
5 |  * 20260821000020_add_coordinator_timetable_slots_write.sql.
6 |  *
7 |  * Background: the coordinator TimetableManager (/coordinator/timetable) inserts
8 |  * timetable_slots, but the table only had timetable_slots_admin_write, so
9 |  * coordinator inserts were rejected with 42501 (verified in the coordinator
10 |  * HAR). The migration adds an institution-scoped coordinator ALL-policy.
11 |  *
12 |  * Cases (allowed AND denied per role × table):
13 |  * 1. coordinator inserts a slot for a section in their institution !' success.
14 |  * 2. teacher inserts a slot !' rejected (no teacher write policy).
15 |  * 3. student inserts a slot !' rejected (no student write policy).
16 |  *
17 |  * Skip-safety: runRlsCases wraps everything in describe.skipIf(!shouldRunRls()),
18 |  * so with no preview secrets nothing connects and `npm run test:rls` exits 0.
19 |  *
20 |  * Teardown note: timetable_slots.section_id references course_sections(id). The
21 |  * default teardown deletes the seeded course_section, which would be blocked by
22 |  * the row the coordinator case inserts. So teardown is wrapped to delete the
23 |  * seeded section's timetable_slots BEFORE delegating to the default teardown.

1 | // Feature: qa-partner-review-remediation, Property 5 (announcement fan-out)
2 | // **Validates: Requirements 15.1, 15.2, 15.5**
3 | //
4 | // Property 5 (design.md): *For any* course roster (including rosters where the
5 | // author is also enrolled, with duplicates, or empty), the set of announcement
6 | // notification recipients SHALL equal the set of distinct actively-enrolled
7 | // students minus the author, and SHALL never include the author.
8 | //
9 | // This test runs against an EXTRACTED PURE MODEL of the fan-out recipient
10 | // computation – NOT a mocked Supabase client. The fan-out logic lives in the
11 | // `fan_out_announcement_notifications` SECURITY DEFINER RPC
12 | // (supabase/migrations/20260603225113_create_fan_out_announcement_notifications.sql):
13 | //
14 | // INSERT INTO public.notifications (user_id, ...)
15 | // SELECT sc.student_id, 'announcement', ...
16 | // FROM public.student_courses sc
17 | // WHERE sc.course_id = v_course
18 | // AND sc.student_id <> v_author -- excludes the author
19 | // AND sc.status = 'active'; -- only active enrollments
20 | //
21 | // Because Postgres INSERT...SELECT emits one row per matching enrollment row,
22 | // duplicate active enrollments would each produce a notification at the DB
23 | // level; the meaningful contract (Req 15.5) is the *recipient set*: the set of
24 | // distinct user_ids that receive a notification. The model below computes that

```

```

25 // recipient set and is checked against an INDEPENDENT oracle so neither a

1 // Feature: qa-partner-review-remediation, Property 9 (declared-object existence)
2 // **Validates: Requirements 20.1, 20.2, 20.5**
3 //
4 // Property 9 (design): *For any* DB object declared as created by a completed
5 // task in the declared-objects manifest, that object SHALL exist in the target
6 // schema; the Declared_Object_Check SHALL pass if and only if every declared
7 // object is present, and on failure SHALL name the missing object and its
8 // declaring task.
9 //
10 // This exercises the PURE verdict `findMissingObjects(declared, presentKeys)`
11 // extracted to `scripts/lib/declared-objects-verdict.mjs` and consumed by
12 // `scripts/check-declared-objects.mjs` (the script does the impure manifest read
13 // + Postgres query; the verdict is pure set difference). The oracle here computes
14 // `missing = declared - present` independently and asserts:
15 //   • missing set equals declared - present (keyed on type+schema+name),
16 //   • the check "passes" iff missing is empty,
17 //   • every missing item carries its declaringTask (Req 20.2).

3 //
4 // CRITICAL: This test MUST FAIL on UNFIXED code – failure confirms the engagement-XP bug exists.
5 // DO NOT fix the source code or this test when it fails. The failure is the SUCCESS criterion
6 // for this exploration task: it proves two halves of `isEngagementXpBug`:
7 // (a) ALLOW-LIST half – a student-JWT `award-xp` call for a source outside the self-trigger
8 // allow-list (login/submission/journal) is rejected `403` and the XP is never awarded. The
9 // affected sources are study_session, wellness_habit, planner_task, weekly_goal,
10 // review_session, review_cycle_complete.
11 // (b) NEVER-INVOKED half – the login (login_streak), perfect_day, grade, and journal flows never
12 // invoke `award-xp` (nor process-streak / a perfect-day helper) from the real client flow.
13 //
14 // This test ENCODES the post-fix expectation (`isEngagementXpBug` from design.md / bugfix.md):
15 // • the 6 affected sources are added to award-xp's `selfTriggeredSources` so a student JWT call
16 // is authorized (status `` 403) and the XP is awarded;
17 // • the server enforces the canonical amount per source, IGNORING any student-supplied xp_amount
18 // (study_session clamp 0-60, wellness_habit institution-configured, planner_task 10,
19 // weekly_goal 25, review_session 15, review_cycle_complete 25; login 10, journal 20,
20 // grade 15, perfect_day 50);
21 // • the login flow advances the streak + awards login XP, the journal flow awards journal XP,
22 // the grade flow fires the grade badge/XP path, and a perfect-day helper awards perfect_day.

1 | // @vitest-environment happy-dom
2 | // Feature: student-experience-remediation, Property 3: Leaderboard never reveals opted-out students
3 | // **Validates: Requirements 6.5, 32.4**
4 | //
5 | // Property statement (design.md):
6 | // For any set of students with arbitrary opt-out flags and any page window
7 | // (limit/offset), the ranked rows produced by the leaderboard query path
8 | // contain no student whose `leaderboard_anonymous` flag is true – across both
9 | // the locked and unlocked states and across every page.
10 | //
11 | // This exercises the real query path: `useLeaderboard` reads the configurable
12 | // cohort settings, then pages through the institution-scoped
13 | // `get_leaderboard_page` RPC. The RPC mock below is a faithful reference of the
14 | // server-side SQL (set-based exclusion of `leaderboard_anonymous = true`,
15 | // ordered by rank, sliced by offset/limit, plus the eligible cohort count). The
16 | // property asserts that the entries the hook exposes – paged to completion –
17 | // never include an opted-out student, in the unlocked state (real rankings) and
18 | // in the locked state (no rows surfaced at all).

1 | // Feature: student-experience-remediation, Property 8: Finalization is idempotent (no double-submit)
2 | // For any number and ordering of finalization triggers (timer expiry, manual finish,
3 | // unmount) guarded by the finalized flag, the quiz attempt submission is invoked at
4 | // most once.
5 | // **Validates: Requirements 3.4**
6 | //
7 | // Task 11.2 fixed AdaptiveQuizSession's timer with a finalize guard so that
8 | // finalization runs at most once across timer expiry, unmount, and manual submit.
9 | // Task 11.3 extracts that guard into the pure 'createIdempotentRunner' helper in
10 | // 'src/lib/idempotentRunner.ts' and the component drives finalization through it.
11 | //
12 | // This property test exercises the REAL helper (not a re-implemented model) so the
13 | // idempotence invariant is asserted against the exact code the component runs: for
14 | // ANY count and ordering of triggers the underlying submission succeeds at most once,

```

```

15 // and no submission is ever issued after a successful one. A failed submission
16 // releases the guard so a later trigger may retry.

5 | // `public.rls_isolation_violations()` SQL function. It scans the migration
6 | // files for `CREATE POLICY` blocks and fails CI if any policy gates access on
7 | // `auth_user_role()` (a role check) but fails to tie rows to the caller's
8 | // identity (`auth.uid()`) or institution (`auth_institution_id`) /
9 | // `institution_id`.
10 | //
11 | // Why this matters: a policy that checks only the role (e.g.
12 | // `auth_user_role() = 'admin'`) with no institution/ownership filter lets a
13 | // staff member in one institution read/write another institution's rows. Six
14 | // such table-policy leaks were found and fixed (student gamification, evidence,
15 | // submissions, sub_clos, audit_logs, badge_spotlight_schedule). This test
16 | // prevents the class of bug from recurring.
17 | //
18 | // Net-state semantics: a policy may be created, then later DROPPed or
19 | // re-CREATED by a subsequent migration. We replay every CREATE/DROP POLICY
20 | // statement in chronological (file-sorted) order and evaluate only the policies
21 | // that still exist at the end, using their final definition.

1 | // Feature: full-profile-audit-remediation, Property 1: Bug Condition – Role-gated functions authorize by prof
2 | // **Validates: Requirements 2.1, 2.2, 2.3**
3 | //
4 | // CRITICAL: This test MUST FAIL on UNFIXED code – failure confirms the role-gate bug exists.
5 | // DO NOT fix the source code or this test when it fails. The failure is the SUCCESS criterion
6 | // for this exploration task: it proves role-gated edge functions read the caller role from the
7 | // JWT (app_metadata/user_metadata, empty on this project) instead of from `profiles`.
8 | //
9 | // This test ENCODES the post-fix expectation (`isRoleGateBug` from design.md / bugfix.md):
10 | // for any caller whose JWT-metadata role is empty but whose profiles.role "
11 | // {admin, coordinator, teacher} and isServiceRole = false, the fixed function SHALL resolve
12 | // role + institution_id from `profiles` by user.id and authorize (status "` 403, authorized = true),
13 | // while CONTINUING to authorize the service-role / x-internal-auth (cron) branch.
